WAIS Offers Publishing Products

New Company Rolls Out Unix-Based Software Products For Commercial Networked Electronic Systems

BY PAUL KAPUSTKA

Menlo Park, Calif.—Start-up WAIS Inc. introduced two commercial software packages for users who want to make electronic publishing services available over a network.

WAIS Server for Unix and WAIS Workstation use an open standard protocol for remote information queries to networked servers. Priced from $10,000 to $50,000, the software is available now for systems running Sun Microsystems' SunOS 4.1.x or Solaris Version 2.1, and for Next workstations. WAIS said future ports will run on Digital Equipment Corp. Alpha machines, and IBM RS/6000 and Hewlett-Packard Unix platforms.

WAIS Inc.'s software is built up from the Wide Area Information Server (WAIS) technology now used by many public information sources, including more than 350 information servers on the Internet, according to the start-up. Former Thinking Machines engineer Brewster Kahle, now president of WAIS Inc., said the success of the home-grown versions of WAIS-type servers indicates that there may also be demand

Future ports will run on DEC Alpha, IBM RS/6000, HP Unix.

for a commercial-strength, vendor-supported network information server product.

"Customers want a company they can go to for support and service," he said.

In addition to its information querying features, the WAIS Server software can log server transactions and restrict access to databases, features that al-low for accurate billing of on-line services accessed. Search features include natural-language questioning ability and relevance feedback for further queries, according to WAIS Inc.

Pricing for the WAIS Server for Unix products begins at $15,000, which includes software, a single CPU license and one-day start-up support. Additional server CPUs can be added to the license for $5,000. A full source-code version of WAIS Server software is priced at $40,000.

The WAIS Workstation product, priced at $10,000, works with databases of a maximum size of 100 Mbytes. WAIS is offering the workstation version of the software at half price through June 30. However, the reduced-price offer is only available to user sites with previous experience in indexing WAIS-type servers and that are on the Internet. Prepayment also is required to qualify for the half-price discount, according to WAIS Inc.

Kahle's former company, Thinking Machines, was part of an original WAIS consortium, a group that also included Apple Computer, Dow Jones and KPMG Peat Marwick. The consortium was involved in the development of an open, standard protocol for remote information queries to networked servers.

Search features include natural-language questioning ability and relevance feedback for further queries, according to WAIS Inc.

Pricing for the WAIS Server for Unix products begins at $15,000, which includes software, a single CPU license and one-day start-up support. Additional server CPUs can be added to the license for $5,000. A full source-code version of WAIS Server software is priced at $40,000.

The WAIS Workstation product, priced at $10,000, works with databases of a maximum size of 100 Mbytes. WAIS is offering the workstation version of the software at half price through June 30. However, the reduced-price offer is only available to user sites with previous experience in indexing WAIS-type servers and that are on the Internet. Prepayment also is required to qualify for the half-price discount, according to WAIS Inc.

Kahle's former company, Thinking Machines, was part of an original WAIS consortium, a group that also included Apple Computer, Dow Jones and KPMG Peat Marwick. The consortium was involved in the development of an open, standard protocol for remote information queries to networked servers.

New Company Rolls Out Unix-Based Software Products For Commercial Networked Electronic Systems

BY PAUL KAPUSTKA

Menlo Park, Calif.—Start-up WAIS Inc. introduced two commercial software packages for users who want to make electronic publishing services available over a network.

WAIS Server for Unix and WAIS Workstation use an open standard protocol for remote information queries to networked servers. Priced from $10,000 to $50,000, the software is available now for systems running Sun Microsystems' SunOS 4.1.x or Solaris Version 2.1, and for Next workstations. WAIS said future ports will run on Digital Equipment Corp. Alpha machines, and IBM RS/6000 and Hewlett-Packard Unix platforms.

WAIS Inc.'s software is built up from the Wide Area Information Server (WAIS) technology now used by many public information sources, including more than 350 information servers on the Internet, according to the start-up. Former Thinking Machines engineer Brewster Kahle, now president of WAIS Inc., said the success of the home-grown versions of WAIS-type servers indicates that there may also be demand

Future ports will run on DEC Alpha, IBM RS/6000, HP Unix.

for a commercial-strength, vendor-supported network information server product.

"Customers want a company they can go to for support and service," he said.

In addition to its information querying features, the WAIS Server software can log server transactions and restrict access to databases, features that al-low for accurate billing of on-line services accessed. Search features include natural-language questioning ability and relevance feedback for further queries, according to WAIS Inc.

Pricing for the WAIS Server for Unix products begins at $15,000, which includes software, a single CPU license and one-day start-up support. Additional server CPUs can be added to the license for $5,000. A full source-code version of WAIS Server software is priced at $40,000.
